Git Pull from GitHub

‹ Previous Next ›

Pull from Remote

SHARE

In the last chapters, we made an account on GitHub and set up SSH.

Then we made some changes directly on GitHub.

Now we want to update our local repository with the changes from GitHub.

Change Platform:
GitHub
Bitbucket
GitLab

Key Pull Commands

- Fetch
- Merge
- Pull

C++ C# AWS W3.CSS HOW TO BOOTSTRAP REACT MYSQL JQUE

Any time you start working on a project, you should get the most recent changes to your local copy.

With Git, you can do that with `pull`.

`pull` is a combination of 2 different commands:

- `fetch`
- `merge`

Let's take a closer look into how `fetch`, `merge`, and `pull` works.

Git Fetch

`git fetch` downloads new data from a remote repository, but does not change your working files or branches. It lets you see what others have pushed before you merge or pull.

Example

```
[user@localhost] $ git fetch origin
remote: Enumerating objects: 5, done.
remote: Counting objects: 100% (5/5), done.
remote: Compressing objects: 100% (3/3), done.
remote: Total 3 (delta 2), reused 0 (delta 0), pack-reu
Unpacking objects: 100% (3/3), 733 bytes | 3.00 KiB/s,
From https://github.com/w3schools-test/hello-world
   e0b6038..d29d69f  master     -> origin/master
```

Now that we have the recent `changes`, we can check our `status`:

Example

W3Schools app iOS & Android NEW Sign In

C++ C# AWS W3.CSS HOW TO BOOTSTRAP REACT MYSQL JQUE

```
nothing to commit, working tree clean
```

We are behind the `origin/master` by 1 `commit`. That should be the updated `README.md`, but lets double check by viewing the `log`:

Example

```
[user@localhost] $ git log origin/master
commit d29d69ffe2ee9e6df6fa0d313bb0592b50f3b853 (origir
Author: w3schools-test <77673807+w3schools-test@users.r
Date:   Fri Mar 26 14:59:14 2021 +0100

    Updated README.md with a line about GitHub

commit e0b6038b1345e50aca8885d8fd322fc0e5765c3b (HEAD -
Merge: dfa79db 1f1584e
Author: w3schools-test
Date:   Fri Mar 26 12:42:56 2021 +0100

    merged with hello-world-images after fixing conflic

...
...
```

That looks as expected, but we can also verify by showing the differences between our local `master` and `origin/master`:

Example

```
[user@localhost] $ git diff origin/master
diff --git a/README.md b/README.md
```

```
 Hello World repository for Git tutorial
 This is an example repository for the Git tutoial on h

-This repository is built step by step in the tutorial.
-
-It now includes steps for GitHub
+This repository is built step by step in the tutorial.
```

That looks precisely as expected! Now we can safely `merge`.

REMOVE ADS

Git Merge

`merge` combines the current branch, with a specified branch.

We have confirmed that the updates are as expected, and we can merge our current branch (`master`) with `origin/master`:

Tutorials Exercises W3Schools app iOS & Android NEW Sign In
C++ C# AWS W3.CSS HOW TO BOOTSTRAP REACT MYSQL JQUE

```
Updating e0b6038..d29d69f
Fast-forward
 README.md | 4 +++-
 1 file changed, 3 insertions(+), 1 deletion(-)
```

Check our `status` again to confirm we are up to date:

Example

```
[user@localhost] $ git status
On branch master
Your branch is up to date with 'origin/master'.

nothing to commit, working tree clean
```

There! Your local git is up to date!

Git Pull

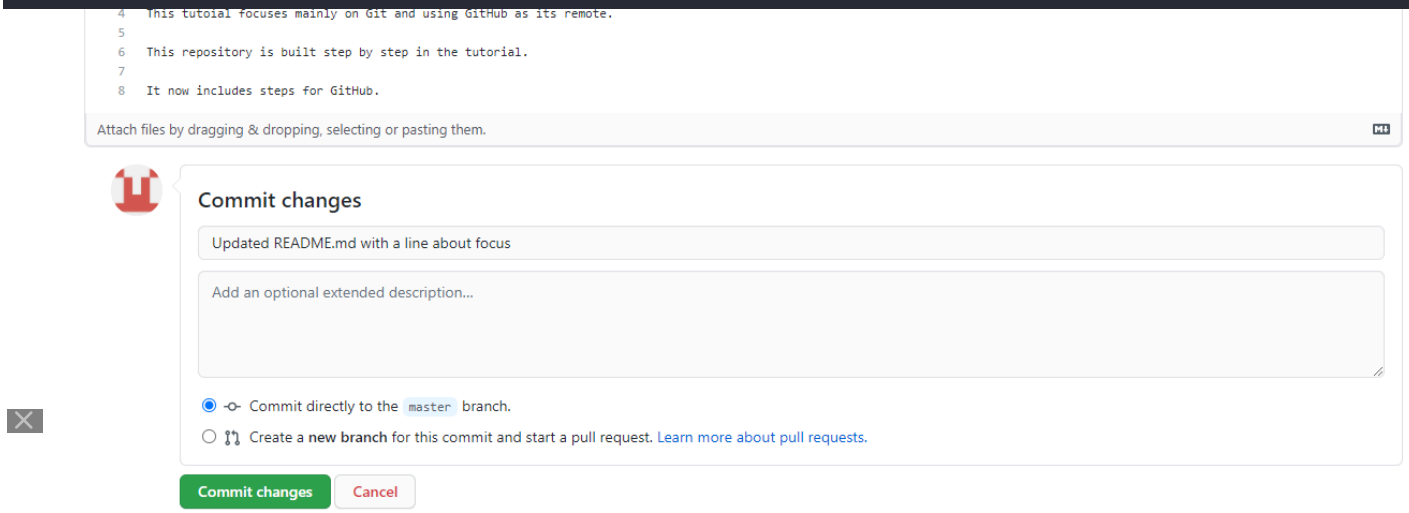

But what if you just want to update your local repository, without going through all those steps?

`pull` is a combination of `fetch` and `merge`.

It is used to pull all changes from a remote repository into the branch you are working on.

Make another change to the Readme.md file on GitHub.

Tutorials Exercises W3Schools app iOS & Android NEW Sign In
C++ C# AWS W3.CSS HOW TO BOOTSTRAP REACT MYSQL JQUE

Use `pull` to update our local Git:

Example

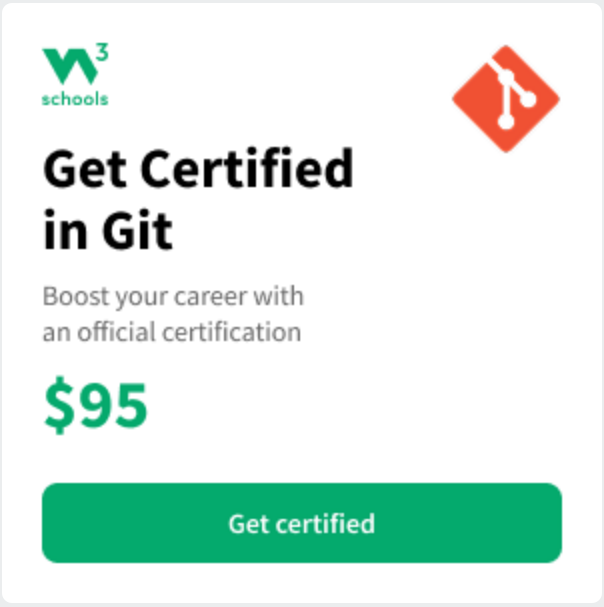

```
[user@localhost] $ git pull origin
remote: Enumerating objects: 5, done.
remote: Counting objects: 100% (5/5), done.
remote: Compressing objects: 100% (3/3), done.
remote: Total 3 (delta 1), reused 0 (delta 0), pack-reu
Unpacking objects: 100% (3/3), 794 bytes | 1024 bytes/s
From https://github.com/w3schools-test/hello-world
    a7cdd4b..ab6b4ed  master       -> origin/master
Updating a7cdd4b..ab6b4ed
Fast-forward
  README.md | 2 ++
  1 file changed, 2 insertions(+)
```

That is how you keep your local Git up to date from a remote repository. In the next chapter, we will look closer at how `push` works on GitHub.
