Git Push to GitHub

SHARE

When we have made changes locally, we want to update our remote repository with the changes.

Transferring our local changes to our remote is done with a `push` command.

There are several commands we can use to push changes to GitHub.

Change Platform:
GitHub
Bitbucket
GitLab

Key Push Commands

- Basic Push
- Force Push
- Push Tags

Basic Push

This command pushes your current branch to the remote repository named `origin`:

Example

```
[user@localhost] $ git push origin
```

This will upload your local commits to GitHub.

You must have already committed your changes with `git commit`.

REMOVE ADS

Force Push

If your push is rejected due to non-fast-forward updates (for example, after a rebase), you can force the push.

Warning: This can overwrite changes on the remote repository. Use with caution!

Tutorials Exercises W3Schools app iOS & Android NEW Sign In
C++ C# AWS W3.CSS HOW TO BOOTSTRAP REACT MYSQL JQUE

Use `--force-with-lease` for a safer force push:

Example

```
[user@localhost] $ git push --force-with-lease origin feature-branch
```

Push Tags

To push all local tags to GitHub:

Example

```
[user@localhost] $ git push --tags
```

To push a specific tag:

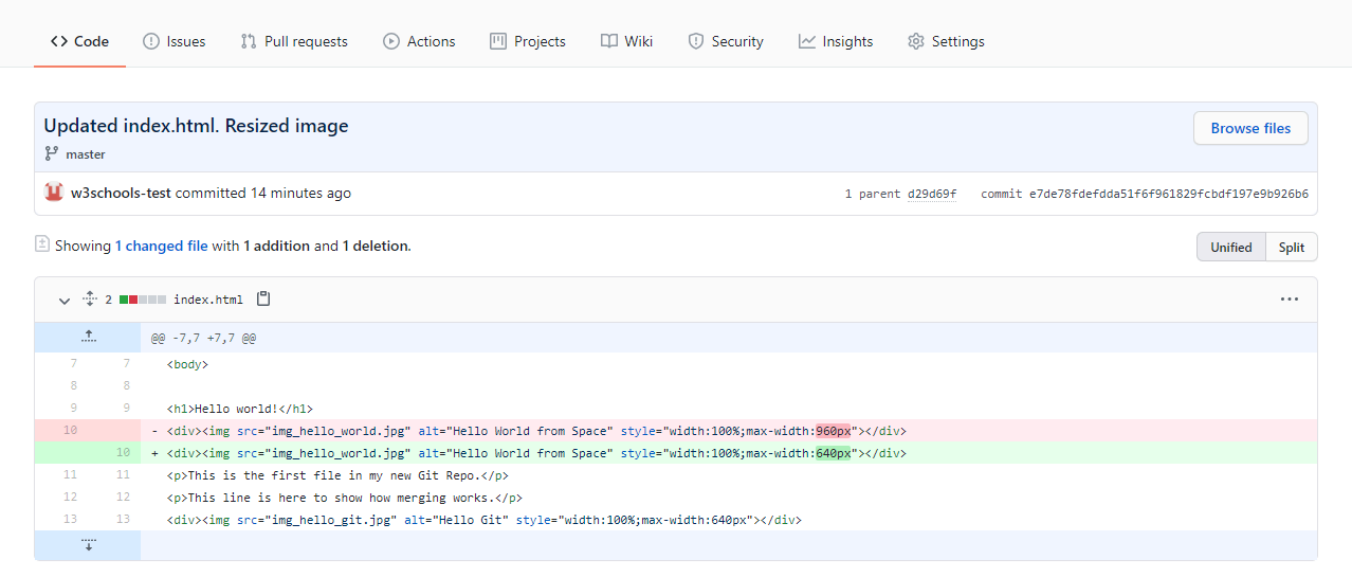

Example

```
[user@localhost] $ git push origin v1.0
```

Troubleshooting

- **Non-fast-forward error:** Happens if someone else pushed to the branch. Run `git pull --rebase` before pushing again.
- **Authentication failed:** Make sure you have access to the repository and your credentials are correct.

Now, we are going to start working on branches on GitHub.

Exercise

Drag and drop the correct command to upload local commits to the remote repository.

```
git ____ origin
```

commit send push
