Today

Welcome to your next lesson: Hello, JavaScript!

I'm putting together your lesson based on what you just learned, what's coming up, and how you learn best.

Step by step, you’re moving forward.

Ron, imagine learning JavaScript like learning Spanish after English 🇪🇸🇺🇸

You’re not starting from zero. The logic you used in Python is still valid:

“Do this, then that. If this, then that. Repeat something.”

What changes is mostly the words and punctuation — the syntax.

Very simple example:

In Python you wrote: print("Hello")
In JavaScript you’ll write: console.log("Hello")

Same idea: “show this message.” Different spelling and symbols.

I want to check your intuition 🔍

Would you say moving from Python to JavaScript is closer to:

A) Learning your first programming language ever

B) Using the same programming ideas but with a different

accent and grammar

Answer in your own words: A or B, and why do you think so?

b

Exactly — B is the right mindset 🎯

You're reusing the same programming brain, just speaking it in a new "accent" (JavaScript syntax) instead of Python.

Next idea, one small step:

Right now you're using an embedded editor here in Maestro (the little code box with Run / Submit). Later in the program, you'll use JavaScript in real places like:

the browser (web pages, dev tools)
front-end frameworks (like React, etc.)

For now, this editor is your safe practice space: you type JavaScript, hit Run, and see the result immediately — without installing anything.

Does that idea make sense: practice here first, then later use the same JavaScript in browsers and frameworks?

Just answer: yes / kind of / not really.

Yes, that makes sense

Nice 👍

Let's connect Python and JavaScript directly.

In Python you did things like:

show a message → print("Hello")

In JavaScript, the same idea is:

show a message → console.log("Hello")

So you can think:

Python: print()
JavaScript: console.log()
Same job, new spelling.
Now I want you to try this in the code editor (not in chat):

Open the editor for this lesson.
Type exactly this line:
Javascript
console.log("Hello, JavaScript!");
End the line with a semicolon ;
Click Run to test, then Submit code when it looks good.

Go ahead and do just that one line in the editor and submit it.

Javascript
console.log("Hello, JavaScript!");
Nice work, Ron — that’s your first real JavaScript program ✅

You just used console.log("Hello, JavaScript!"); to send a message to the console, just like print("...") in Python.

One new small piece now: the semicolon at the end.

In JavaScript, a line like:

Javascript
console.log("Hello, JavaScript!");
is called a statement — a single instruction.

The semicolon ; marks the end of that statement, like a period at the end of a sentence.

So:

```
console.log("Hello, JavaScript!");
```

is one complete statement, finished by the semicolon.

Quick check-in:

In your own words, what is the semicolon doing at the end of that line? One short sentence is enough.

just like in c, signals the end of a statement

Exactly right — same idea as in C: it signals the end of a statement ✅

So you've got:

Second-language mindset ✔
Why we use the embedded editor now ✔
console.log("Hello, JavaScript!"); working ✔
Semicolon as statement terminator ✔
One last tiny concept for this lesson: top-to-bottom execution.

If you put two lines in the editor:

Javascript
```
console.log("First");
console.log("Second");
```
JavaScript runs them from top to bottom, so the console will show:

First
Second
not the other way around.

Your turn in the editor:

In the code editor, write these two lines in this order:

Javascript
console.log("Line 1");
console.log("Line 2");
Then:

Click Run to see the output
Click Submit code

Don’t tell me the output yet — just run and submit the code.

Javascript
console.log("Line 1");
console.log("Line 2");
Perfect submission 🎯

Your code:

console.log("Line 1");
console.log("Line 2");

ran top to bottom, and the console showed:

Line 1
Line 2

You’ve now:

Treated JavaScript as a second language (same logic, new syntax)
Understood why we start in the embedded editor before browsers/frameworks
Used console.log("Hello, JavaScript!"); successfully
Shown you know the semicolon ends a statement

You’ve fully mastered this lesson 🙌

When you’re ready, go ahead and click Next Lesson in the

```
    Learn tab to keep going.
