Today

Welcome to your next lesson: Challenge: JS basics.

I'm getting your personalized lesson ready — based on what you've learned, what's ahead, and how you learn best.

Step by step, you’re moving forward.

Ron, for this lesson I’m going to run you through a short challenge round in JavaScript — translating ideas from Python and testing your JS basics 💪

We’ll go one task at a time. You’ll mostly work in the code editor (JS), run your code, then hit Submit code. I won’t correct you in the middle; feedback comes at the end.

First challenge (1 of ~8) 🎯

In Python you might write:

```
Python
name = "Ron"
age = 42
print("Name:", name)
print("Age:", age)
```

Task:

In the JavaScript editor, write code that does the same thing using let or const and console.log.

Step by step:

Declare a variable for the name.
Declare a variable for the age.
Log the name line.

Log the age line.

Use valid JavaScript syntax and end lines with semicolons.

Go ahead and write this in the JS code editor, run it, and then press Submit code.

Javascript
```
const name = "Ron";
let age = 42;
console.log(`Name: ${name}`);
console.log(`Age: ${age}`);
```
Nice, code runs and matches the Python behavior 🎯

Challenge 2 (coding) 🧩

In Python you might check a score like this:

Python
```
score = 85
if score >= 90:
    print("A")
elif score >= 80:
    print("B")
else:
    print("Keep going")
```
Task:

In the JavaScript editor, write equivalent code that:

Stores a score number.
Uses if, else if, else with parentheses and curly braces.
Uses console.log to print the same messages.

Remember: JavaScript style looks like:

Javascript
```
if (condition) {
  // code
}
```
Write it in the editor, run it, then press Submit code.

Javascript
```
let score = 85;
if (score >= 90) {
```

```
    console.log("A");
} else if (score >= 80) {
    console.log("B");
} else {
    console.log("Keep going");
}
```

Nice work, Ron — that runs exactly like the Python version 👌

Challenge 3 (coding) 🧩

In Python:

```
Python
x = 10
y = "5"
print(type(x))
print(type(y))
```

Task:

In the JavaScript editor, do the equivalent:

Create a number variable x with value 10.
Create a string variable y with value "5".
Use console.log(typeof x);
Use console.log(typeof y);

Write this in the JS editor, run it, then press Submit code.

```
Javascript
let x = 10;
let y = "5";
console.log(typeof x);
console.log(typeof y);
```

Output looks good ✅

Challenge 4 (coding) 🧩

In Python you might write:

```
Python
steps = 3
steps = steps - 1
print(steps)
```

Task (pay close attention to = vs -):

In the JavaScript editor:

Declare a variable steps with value 3 using let.
Reassign steps so it becomes one less than before.
console.log(steps);

Write this in the JS editor, run it, then press Submit code.

Javascript
```
let steps = 3
steps = steps - 1
console.log(steps);
```
Nice, that reassignment is spot on ✅

Challenge 5 (coding) 🧩

Python version:

Python
```
temperature = 30
if temperature === 30:   # (pretend Python allowed this)
    print("Exactly 30")
```
Task in JavaScript:

Create a variable temperature with value 30.
Write an if statement that checks temperature === 30.
Inside the if block, log: Exactly 30 with console.log.

Write this in the JS editor, run it, then press Submit code.

Javascript
```
let temperature = 30;
if (temperature === 30) {
    console.log("Exactly 30");
}
```
Challenge 6 (coding – template literal) 🧩

In Python you might write:

Python
```
name = "Ron"
```

```
city = "Dallas"
print(f"Hello, {name} from {city}!")
Task in JavaScript:

Create name and city variables with any values you like.
Use a template literal (backticks + ${}) to log a message like:
Hello, Ron from Dallas!

Write this in the JS editor, run it, then press Submit code.

Javascript
let name = "Ron";
let city = "Dallas";
console.log(`Hello, ${name} from ${city}`);

Nice work pushing through all those JS basics challenges, Ron 🎯

Here’s what you showed clearly:

You can translate simple Python code to JavaScript using let / const and console.log.
You handle conditionals with if / else if / else, parentheses, and curly braces correctly.
You understand primitive types and typeof (number vs string).
You’re solid on reassignment with = and using expressions like steps = steps - 1.
You correctly used strict equality === in conditions.
You can build clean template literals with backticks and ${}.

From what you wrote and ran, you’ve met the goal for this lesson ✅

Next up, you’ll keep building on this JavaScript base.

If there’s any piece from these challenges you want to quickly revisit (like typeof, ===, or template literals), tell me which one and I’ll go through a focused example with you.

How would you rate this lesson?
