MySQL Aggregate Functions

SHARE

An aggregate function is a function that performs a calculation on a set of values, and returns a single value.

Aggregate functions are often used with the `GROUP BY` clause of the `SELECT` statement. The `GROUP BY` clause splits the result-set into groups of values and the aggregate function can be used to return a single value for each group.

The most commonly used SQL aggregate functions are:

- `MIN()` - returns the smallest value of a column
- `MAX()` - returns the largest value of a column
- `COUNT()` - returns the number of rows in a set
- `SUM()` - returns the sum of a numerical column
- `AVG()` - returns the average value of a numerical column

Aggregate functions ignore null values (except for `COUNT(*)`).
