MySQL CROSS JOIN

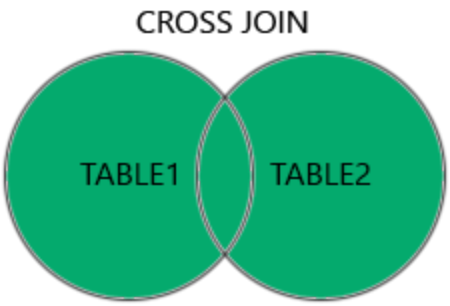

‹ Previous Next ›

MySQL CROSS JOIN

SHARE

The `CROSS JOIN` clause returns the **Cartesian product** of two or more tables (combines every row from the first table with every row from the second table).

Note: So, if the first table has 100 rows, and the second table has 500 rows, the result set will be 100x500 rows. Be aware that `CROSS JOIN` can potentially return **very large result-sets**!

CROSS JOIN Syntax

Tutorials Exercises W3Schools app iOS & Android NEW Sign In
. CSS JAVASCRIPT SQL PYTHON JAVA PHP C C++ C# AWS

```
CROSS JOIN table2;
```

Demo Database

Below is a selection from the "Customers" table:

CustomerID	CustomerName	ContactName	Address	City	PostalCode	Cou
1	Alfreds Futterkiste	Maria Anders	Obere Str. 57	Berlin	12209	Gerr
2	Ana Trujillo Emparedados y helados	Ana Trujillo	Avda. de la Constitución 2222	México D.F.	05021	Mex
3	Antonio Moreno Taquería	Antonio Moreno	Mataderos 2312	México D.F.	05023	Mex

And a selection from the "Orders" table:

OrderID	CustomerID	EmployeeID	OrderDate	ShipperID
10308	2	7	1996-09-18	3
10309	37	3	1996-09-19	1
10310	77	8	1996-09-20	2

MySQL CROSS JOIN Examples

The following SQL returns the Cartesian product of "Customers" and "Orders":

Example

Get your own SQL Server

```
SELECT Customers.CustomerName, Orders.OrderID
FROM Customers
CROSS JOIN Orders;
```

Try it Yourself »

If you add a `WHERE` clause (if table1 and table2 has a relationship), the `CROSS JOIN` will produce the same result as the `INNER JOIN` clause:

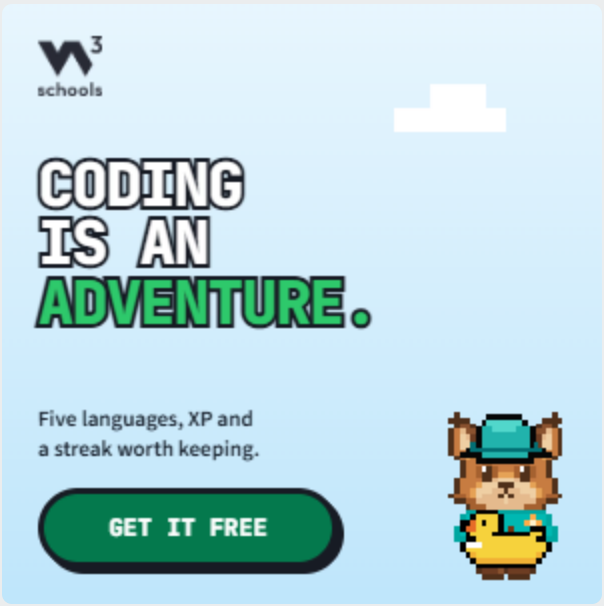

Example

```
SELECT Customers.CustomerName, Orders.OrderID
FROM Customers
CROSS JOIN Orders
WHERE Customers.CustomerID=Orders.CustomerID;
```
