MySQL Joins

‹ Previous Next ›

The MySQL JOIN Clause

SHARE

The `JOIN` clause is used to combine rows from two or more tables, based on a related column between them.

Here are the different types of JOINs in MySQL:

- `INNER JOIN`: Returns only rows that have **matching values** in both tables
- `LEFT JOIN`: Returns **all rows from the left table**, and only the matched rows from the right table
- `RIGHT JOIN`: Returns **all rows from the right table**, and only the matched rows from the left table
- `CROSS JOIN`: Returns the **Cartesian product** of two or more tables

Look at an order in "Orders" table:

OrderID	CustomerID	OrderDate

Then, look at a customer in the "Customers" table:

CustomerID	CustomerName	ContactName	Country
2	Ana Trujillo Emparedados y helados	Ana Trujillo	Mexico

Here we see that the "CustomerID" column in the "Orders" table refers to the "CustomerID" in the "Customers" table. The relationship between the two tables above is the "CustomerID" column.

Then, we can create the following SQL statement (that contains an `INNER JOIN`), that selects records that have matching values in both tables:

Example

Get your own SQL Server

```
SELECT Orders.OrderID, Customers.CustomerName, Orders.OrderDate
FROM Orders
INNER JOIN Customers ON Orders.CustomerID=Customers.CustomerID;
```

Try it Yourself »

and it will produce something like this:

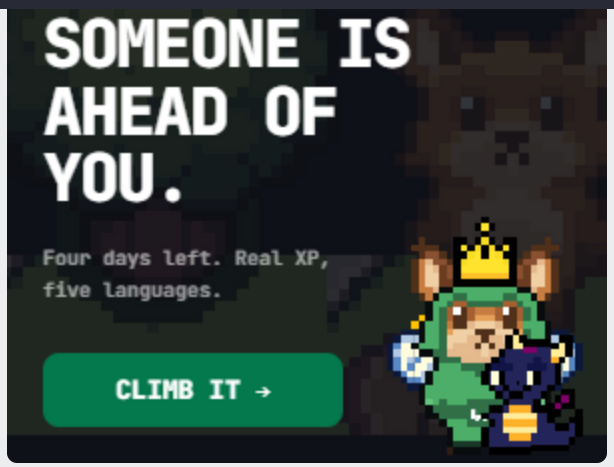

OrderID	CustomerName	OrderDate
10308	Ana Trujillo Emparedados y helados	1996-09-18
10365	Antonio Moreno Taquería	1996-11-27
10383	Around the Horn	1996-11-15
10355	Around the Horn	1996-12-16
