MySQL RIGHT JOIN

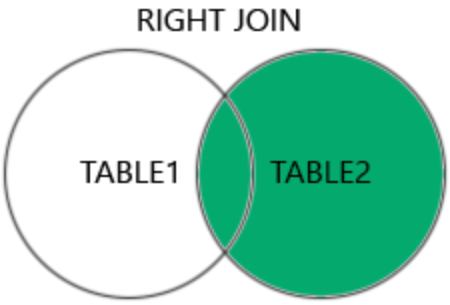

‹ Previous
Next ›

MySQL RIGHT JOIN

SHARE

The `RIGHT JOIN` clause returns **all rows from the right table** (table2), and only the matched rows from the left table (table1).

If there is no match in the left table, the result for the columns from the left table will be NULL.

RIGHT JOIN Syntax

Tutorials Exercises W3Schools app iOS & Android NEW Sign In
. CSS JAVASCRIPT SQL PYTHON JAVA PHP C C++ C# AWS

```
RIGHT JOIN table2
ON table1.condition_column = table2.condition_column;
```

Note: The syntax combines two tables based on a **related column**, and the `ON` keyword is used to specify the matching condition.

Demo Database

In this tutorial we will use the well-known Northwind sample database.

Below is a selection from the "Orders" table:

OrderID	CustomerID	EmployeeID	OrderDate	ShipperID
10308	2	7	1996-09-18	3
10309	37	3	1996-09-19	1
10310	77	8	1996-09-20	2

And a selection from the "Employees" table:

EmployeeID	LastName	FirstName	BirthDate	Photo
1	Davolio	Nancy	1968-12-08	EmpID1.pic
2	Fuller	Andrew	1952-02-19	EmpID2.pic
3	Leverling	Janet	1963-08-30	EmpID3.pic

Here we see that the **related column** between the two tables above, is the "EmployeeID" column.

MySQL RIGHT JOIN Example

The following SQL will return all employees, and any orders they might have placed:

Example

Get your own SQL Server

```
SELECT Orders.OrderID, Employees.LastName, Employees.FirstName
FROM Orders
RIGHT JOIN Employees ON Orders.EmployeeID = Employees.EmployeeID
ORDER BY Orders.OrderID;
```

Try it Yourself »

Note: The `RIGHT JOIN` keyword returns all records from the right table (Employees), even if there are no matches in the left table (Orders).

Exercise ?

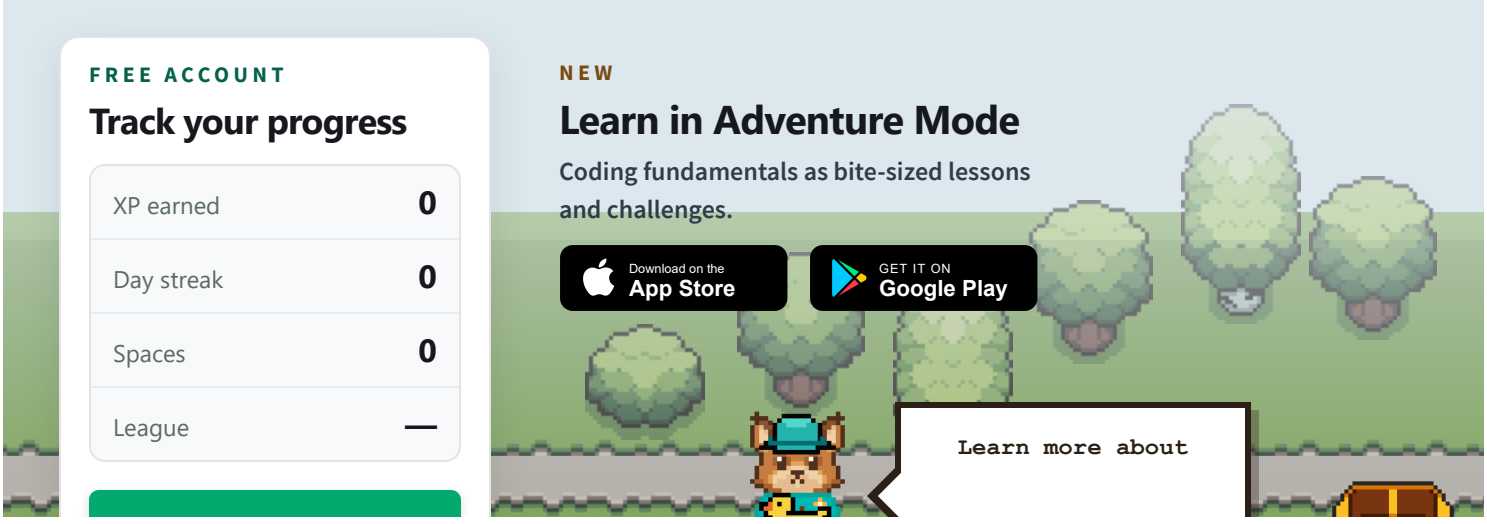

Drag and drop all keywords to make a legal SQL statement

```
[          ] Orders.OrderID, Customers.CustomerName
[          ] Orders
[          ] Customers [          ]
Orders.CustomerID=Customers.CustomerID;
```

FROM SELECT ON RIGHT JOIN
