The MySQL UNION ALL Operator

The `UNION ALL` operator is used to combine the result-set of two or more `SELECT` statements.

The `UNION ALL` operator includes all rows from each statement, **including any duplicates**.

Requirements for `UNION ALL`:

- Every `SELECT` statement within `UNION` must have the same number of columns
- The columns must also have similar data types
- The columns in every `SELECT` statement must also be in the same order
