3. Welcome to PY101!

Today

Welcome to your next lesson: Welcome to PY101!

I'm preparing your personalized lesson based on what you're set to learn next and the best ways for you to build on what you know.

Step by step, you're moving forward.

Ron, in this lesson we're just getting you oriented in PY101 — no coding yet, just the "map" of the course and how you'll be graded. ?

Here's how the course is structured:

- Unit 1: Writing your first program

  You'll start by running tiny programs, seeing output, using simple values, and solving small real-world style problems. Think: "getting the computer to follow basic instructions."
- Unit 2: Core foundations

  You go deeper into the basics you'll use all the time: different ways of doing math, taking input, seeing and fixing simple errors, and starting to organize code into reusable pieces.
- Unit 3: Decisions and loops

  This is where programs start to feel smart: making choices (if this, do that) and repeating actions (loops) so the computer can handle many items or steps for you.
- Unit 4: Introduction to Python summary

  You bring things together: working with text, simple collections (like lists), and solving integrated problems that feel closer to real tasks.

  Each unit builds on the last — like leveling up in a game rather than learning everything at once. ?

  Grading and reviews:
- At the end of each unit, there is a review.
- Reviews 1–3 (for Units 1–3):
- Worth 10% each of your total course grade
- Not timed
- Unlimited retakes — you can keep trying until you're happy
- Final review (Unit 4):
- Worth 60% of your total course grade
- Timed
