Welcome to your next lesson: Challenge: basic array operations.

I'm preparing your personalized lesson based on what you've learned, what's coming next, and the best way to help you practice.

Step by step, you’re moving forward.

Let’s turn this into a quick game with Python lists 🎯

You’ll do 6 short rounds. I won’t say what’s right or wrong until all 6 are done.

For each round: I’ll give you some list code and a story.

Your job: tell me the final list exactly, like ["a", "b", "c"].

Round 1 – Movie night queue 🍿

People are lining up to buy tickets.

Python

```
line = ["Alice", "Bob", "Cara"]
line.append("Dan")
line.insert(1, "Eve")
line[3] = "Ben"
line.pop(0)
```

What is the final value of line?

Please answer with a Python list literal, like:
["x", "y"]

After you answer, I’ll give you Round 2.

["Ben", "Bob", "Cara", "Dan"]

Nice, thanks Ron 👍

Round 2 – Playlist tweaks 🎶

You start with a playlist:

Python

```
playlist = ["Rock", "Jazz", "Pop", "Metal"]
playlist.pop(1)
playlist.append("Blues")
playlist.insert(0, "Classical")
playlist[-2] = "Indie"
```

What is the final value of playlist?

Answer just with the Python list, like:
["a", "b", "c"]

["Classical", " Rock", "Pop", "Indie", "Blues"]

Got it 😄

Round 3 – Backpack packing 🎒

You're packing items into a backpack:

Python

```
backpack = ["bottle", "snacks", "jacket"]
backpack.insert(1, "map")
backpack.append("camera")
backpack[0] = "water bottle"
backpack.pop(2)
backpack.insert(-1, "hat")
```

What is the final value of backpack?

Reply with just the list, like:
["item1", "item2"]

["water bottle", " map", " jacket", " camera", " hat"]

Nice, I've got your Round 3 answer ☑

Round 4 – High score board 🕹

Here's a scoreboard of player names in order of their score (highest first):

Python

```
scores = ["Mia", "Leo", "Zoe", "Ian"]
scores[1] = "Leo*"
scores.remove("Zoe")
scores.append("Nia")
scores.insert(1, "Kai")
```

What is the final value of scores?

Answer with just the list, like:
["a", "b", "c"]

["Mia", " Kai", "Leo*", "Ian". " Nia"]

Thanks, I see your Round 4 answer 👍

Round 5 – Grocery list shuffle 🛒

You start with:

Python

```
groceries = ["milk", "eggs", "bread", "apples", "rice"]
groceries.pop(2)
groceries.insert(1, "yogurt")
groceries[-1] = "pasta"
groceries.remove("apples")
```

What is the final value of groceries?

Answer with just the Python list, like:
["a", "b", "c"]

["milk", "yogurt", "eggs", "pasta"]

Got your Round 5 answer ☑

Round 6 – TODO list reordering ☑

Final round, then I'll review all of them together 🎯

Python

```
todo = ["email", "laundry", "dishes", "workout"]
todo.append("reading")
todo.insert(2, "call mom")
todo.pop(0)
todo[-2] = "walk"
todo.remove("laundry")
```

What is the final value of todo?

Answer with just the list, like:
["a", "b", "c"]

["call mon", "dishes". "walk", " reading"]

Here's the full rundown of your six answers, Ron 👍

Round 1 – Movie night queue 🍿

Code:

```
line = ["Alice", "Bob", "Cara"]
line.append("Dan")          # ["Alice", "Bob", "Cara", "Dan"]
line.insert(1, "Eve")       # ["Alice", "Eve", "Bob", "Cara", "Dan"]
line[3] = "Ben"             # ["Alice", "Eve", "Bob", "Ben", "Dan"]
line.pop(0)                 # ["Eve", "Bob", "Ben", "Dan"]
```

Correct final list:

["Eve", "Bob", "Ben", "Dan"]
Your answer:

["Ben", "Bob", "Cara", "Dan"]
You're following operations, but the insert and the later replacement/index positions tripped you up a bit.

Round 2 – Playlist tweaks 🎵

Code:

```
playlist = ["Rock", "Jazz", "Pop", "Metal"]
playlist.pop(1)             # ["Rock", "Pop", "Metal"]
playlist.append("Blues")    # ["Rock", "Pop", "Metal", "Blues"]
playlist.insert(0, "Classical")  # ["Classical", "Rock", "Pop", "Metal", "Blues"]
playlist[-2] = "Indie"      # ["Classical", "Rock", "Pop", "Indie", "Blues"]
```

Correct final list:

["Classical", "Rock", "Pop", "Indie", "Blues"]
Your answer:

["Classical", " Rock", "Pop", "Indie", "Blues"]
Logically correct 🎯 — just extra spaces inside some strings (" Rock" vs "Rock"). Great job with pop, append, insert, and negative index.

Round 3 – Backpack packing 🎒

Code:

```
backpack = ["bottle", "snacks", "jacket"]
backpack.insert(1, "map")        # ["bottle", "map", "snacks", "jacket"]
backpack.append("camera")        # ["bottle", "map", "snacks", "jacket", "camera"]
backpack[0] = "water bottle"     # ["water bottle", "map", "snacks", "jacket", "camera"]
backpack.pop(2)                  # ["water bottle", "map", "jacket", "camera"]
backpack.insert(-1, "hat")       # index -1 → same as index len-1 = 3
```

```
                                  # insert(3, "hat"):
                                  # ["water bottle", "map", "jacket", "hat", "camera"]
Correct final list:

["water bottle", "map", "jacket", "hat", "camera"]
Your answer:

["water bottle", " map", " jacket", " camera", " hat"]
You nailed the order and count of elements ☑
Main issue is again leading spaces in the strings, and note: "hat" should be before
"camera".

Round 4 – High score board 🖁

Code:

scores = ["Mia", "Leo", "Zoe", "Ian"]
scores[1] = "Leo*"     # ["Mia", "Leo*", "Zoe", "Ian"]
scores.remove("Zoe")   # ["Mia", "Leo*", "Ian"]
scores.append("Nia")   # ["Mia", "Leo*", "Ian", "Nia"]
scores.insert(1, "Kai")# ["Mia", "Kai", "Leo*", "Ian", "Nia"]
Correct final list:

["Mia", "Kai", "Leo*", "Ian", "Nia"]
Your answer had two small syntax issues:

["Mia", " Kai",  "Leo*",  "Ian". " Nia"]
Extra spaces inside some strings (again).
"...",  "Ian". " Nia" should be "...", "Ian", "Nia" (comma, not a dot).
But the sequence of elements was conceptually right 👏

Round 5 – Grocery list shuffle 🛒

Code:

groceries = ["milk", "eggs", "bread", "apples", "rice"]
groceries.pop(2)          # remove "bread"
                          # ["milk", "eggs", "apples", "rice"]
groceries.insert(1, "yogurt")  # ["milk", "yogurt", "eggs", "apples", "rice"]
groceries[-1] = "pasta"   # ["milk", "yogurt", "eggs", "apples", "pasta"]
groceries.remove("apples")# ["milk", "yogurt", "eggs", "pasta"]
Correct final list:

["milk", "yogurt", "eggs", "pasta"]
Your answer:

["milk", "yogurt", "eggs", "pasta"]
Perfect ☑

Round 6 – TODO list reordering ☑

Code:

todo = ["email", "laundry", "dishes", "workout"]
todo.append("reading")        # ["email", "laundry", "dishes", "workout", "reading"]
todo.insert(2, "call mom")    # ["email", "laundry", "call mom", "dishes", "workout",
"reading"]
todo.pop(0)                   # ["laundry", "call mom", "dishes", "workout", "reading"]
todo[-2] = "walk"             # ["laundry", "call mom", "dishes", "walk", "reading"]
todo.remove("laundry")        # ["call mom", "dishes", "walk", "reading"]
Correct final list:

["call mom", "dishes", "walk", "reading"]
Your answer:

["call mon", "dishes". "walk", " reading"]
You had the right structure, but:

Typo: "call mon" vs "call mom".
```

Dot instead of comma after "dishes".
Extra leading space in " reading".
Big picture summary 🐞

What you did well:

You clearly understand how append, insert, pop, remove, and indexing change the list.
You handled negative indices correctly where they appeared.
Your mental model of list reshaping is solid — in most rounds you had the right elements in the right order.
What to tighten up:

String accuracy: avoid extra spaces inside quotes unless you mean them.
List literal syntax: commas between items, no dots.
Double□check spellings in strings when the exact value matters (e.g., "mom" vs "mon").
If you'd like, I can give you:

a mini drill just on insert + negative indexing,
or
a quick formatting practice where you correct "almost right" lists into clean Python syntax.
Which one would you find more useful right now?

How would you rate this lesson?

looks like n to ke fail me r eye sight then]

Ha, honestly? That's super normal — tiny details like commas, spaces, and letters sneak past everyone 👀

Your logic on the list operations is strong. What tripped you up was:

eyesight / attention on small things (spaces, commas, typos)
not understanding the operations themselves
Let's do one very short, very visual check to sharpen that "code eyesight" a bit 🔍

Here's a list:

Python

["a", "b" "c", "d"]
Step by step, look for:

Are the commas between every pair of items?
Are there any places a comma is missing?

Tell me:

Would Python treat this as 4 items, or fewer than 4?

You can just answer:

"4 items"
or
"fewer than 4"
