Today

Welcome to your next lesson: Objects = data + behavior.

I'm preparing your personalized lesson based on what you've already learned, what's coming up next, and how you learn best.

Keep it up, every step counts.

Imagine you have a virtual pet dog on your screen 🐶

To describe this dog in a clear way, there are two different kinds of things we care about:

What the dog is like right now (for example: name, age, how hungry it is)
What the dog can do (for example: eat, sleep, bark, play)

In object thinking, we say:

An object is something that combines what it has/is like (data) and what it does (behavior).

Let’s anchor this with your own example 👇

Think of a real pet you know (yours, a friend’s, or just make one up):

Just name it and give me:

1–2 things it has/is like
1–2 things it does

For example (don’t copy this, make your own):

“Cat named Milo, 2 years old; he sleeps a lot and chases

toys.”

Your turn 🙂

dog named Angie, 9 years old, breed golden retriver, loves smelly socks

Nice, Angie sounds like a fun dog 😄

Let’s sort what you wrote into the two buckets:

What Angie is like (data / state):

name: Angie
age: 9 years old
breed: golden retriever
What Angie does (behavior / actions):

loves smelly socks 🦴 (that’s really about her typical action with socks)

So in object terms:

Angie the dog would be an object that combines:

State (name, age, breed)
Behavior (going after smelly socks)

Quick check for you 🧠

If I add one more detail:

“Angie is very tired right now.”

Would you put “very tired right now” under:

what Angie is like right now (state), or
what Angie does (behavior)?

You can just answer: “state” or “behavior”.

behavior

Nice try — this is where the idea of state gets a bit clearer 🙂

“Very tired right now” is actually state, not behavior.

State = what Angie is like right now → tired, hungry, happy, etc.
Behavior = what Angie does → sleep, eat, bark, steal socks, etc.

So:

“Very tired right now” → state
“Is sleeping on the couch” → behavior
Want to see a small visual with two columns (state vs behavior) for a pet to make this super clear? 👀

Show me the two columns

Here’s a visual of Angie as an object: state on the left, behavior on the right 👇

Look at it for a moment and notice:

Left side = things Angie is like right now (can change over time, but they’re descriptions)
Right side = things Angie can do (actions)
Quick check, just to be sure:

If we add hunger: very hungry for Angie, which side would that belong to in this picture — state or behavior?

Pet State vs Behavior

state

What do you think? Take your time and pick the best option in the question above 👆

Your virtual pet is named Luna, is 3 years old, and can play fetch. Which choice correctly identifies Luna’s state and behavior?

A.
State: named Luna and 3 years old; behavior: can play fetch.

B.
State: can play fetch; behavior: named Luna and 3 years old.

C.
State and behavior are the same thing.

D.
Luna has behavior but no state.

You’re very close, Ron — you’ve got the right pieces, they’re just swapped 🧠

For Luna:

State = what Luna is like right now

named Luna
3 years old
Behavior = what Luna does / can do

can play fetch

So the correct choice is:

State: named Luna and 3 years old; behavior: can play fetch.

A good shortcut:

If it answers “What is the pet like?” → state
If it answers “What does the pet do?” → behavior
Want to try another quick pet example so this really locks in? 😊

just misread though it said which mis represtns

Got it, that makes sense 👍 Misreads happen.

The good news is: your earlier answers show you do understand the idea — you correctly picked “hunger: very hungry” = state, which is exactly right.

Let’s lock it in with one more super-quick check about Angie 🐶:

Which one is behavior?

Angie is 9 years old
Angie runs to the door when the bell rings

You can just answer: “first” or “second”.

behavior is runs out the door

Exactly 🎯

“Angie is 9 years old” → state (what she is like)
“Angie runs to the door when the bell rings” → behavior (what she does)

You’re classifying these correctly now 👍

Before we move on:

Do you feel clear on this rule?

State = what the object/pet is like right now

Behavior = what the object/pet does

Answer however feels right:

“Yes, it’s clear”
or “Mostly, but I’m unsure about ___”

I’ll adjust the next step based on that.

Yes, it’s clear

Awesome 💪 since it’s clear now, let’s zoom out for a second.

Here’s the big idea you’ve been using:

An object (like Angie) is something that combines:

State → what it is like right now (name, age, breed, hunger, tiredness)
Behavior → what it does (runs to the door, steals socks, sleeps, eats)

That “data + behavior together in one thing” is exactly how we think in objects.

Quick extra check with a non-pet example, just to flex your understanding a bit:

Take a phone 📱

Tell me one state and one behavior for a phone, in your own words.

Example format:

state: ___
behavior: ___
state: analog or digital, color: blue,white,...

behavior: connect to a wifi, answer a call

Perfect, Ron 🔥

For a phone 📱:

State (what it’s like):
analog or digital
color: blue, white, etc.
Behavior (what it does):
connect to Wi-Fi
answer a call

You’re using the state/behavior split correctly across pets and devices now 👌

Let’s do one last, quick pet check to really nail this idea:

Imagine a cat named Shadow:

Shadow is 5 years old
Shadow scratches the couch

Which is state, and which is behavior?

You can answer like:

state: ___
behavior: ___
state: 5 years old
behavior: Typical cat (scatches the couch0

Exactly right again 💯

For Shadow the cat:

State: 5 years old (what Shadow is like)
Behavior: scratches the couch (what Shadow does — very on brand for a cat 😼)

You've now:

Correctly identified objects (pet, phone)
Separated state (data / what it's like) from behavior (actions / what it does) across several examples

That's exactly what this lesson was aiming for 🎯

You've basically mastered this idea.

Do you feel ready to wrap up this lesson and move to the next one, or do you want one more tricky example before we finish?

I'm ready for the next lesson

Nice work, Ron 🎉

Here's what you just nailed in this lesson:

You treated things like Angie, Luna, phones, and cats as objects.
For each one, you clearly split:
State → what it is like right now (name, age, color, tired, hungry, etc.)
Behavior → what it does (runs to the door, steals socks, connects to Wi-Fi, scratches the couch)

That mental habit — "what is it like?" vs "what does it do?" — is the core of thinking in objects. You're already using it correctly across different examples 🧠

When you're ready, hit Next lesson in the Learn tab, and we'll build on this foundation step by step.

If anything from this lesson feels fuzzy later, just ask and we'll revisit it quickly.
