React ES6 Modules

‹ Previous Next ›

Modules

SHARE

JavaScript modules allow you to break up your code into separate files.

This makes it easier to maintain the code-base.

ES Modules rely on the `import` and `export` statements.

Export

You can export a function or variable from any file.

Let us create a file named `person.js`, and fill it with the things we want to export.

There are two types of exports: Named and Default.

Example

Get your own React.js Server

In-line individually:

person.js

```
export const name = "Tobias"
export const age = 18
```

Example

All at once at the bottom:

person.js

```
const name = "Tobias"
const age = 18

export { name, age }
```

Default Exports

Let us create another file, named `message.js`, and use it for demonstrating default export.

You can only have one default export in a file.

Tutorials Exercises W3Schools app iOS & Android NEW Sign In
. CSS JAVASCRIPT SQL PYTHON JAVA PHP C C++ C# AWS

message.js

```
const message = () => {
  const name = "Tobias";
  const age = 18;
  return name + ' is ' + age + 'years old.';
};

export default message;
```

Import

You can import modules into a file in two ways, based on if they are named exports or default exports.

Named exports must be destructured using curly braces. Default exports do not.

Example

Import named exports from the file person.js:

```
import { name, age } from "./person.js";
```
