React Hooks

‹ Previous Next ›

Hooks allow functions to have access to state and other React features without using classes.

They provide a more direct API to React concepts like props, state, context, refs, and lifecycle.

What is a Hook?

SHARE

Hooks are functions that let you "hook into" React state and lifecycle features from functional components.

Example:

Get your own React.js Server

Here is an example of a Hook. Don't worry if it doesn't make sense. We will go into more detail in the next section.

CSS JAVASCRIPT SQL PYTHON JAVA PHP C C++ C# AWS

```
function FavoriteColor() {
  const [color, setColor] = useState("red");

  return (
    <>
      <h1>My favorite color is {color}!</h1>
      <button
        type="button"
        onClick={() => setColor("blue")}
      >Blue</button>
      <button
        type="button"
        onClick={() => setColor("red")}
      >Red</button>
      <button
        type="button"
        onClick={() => setColor("pink")}
      >Pink</button>
      <button
        type="button"
        onClick={() => setColor("green")}
      >Green</button>
    </>
  );
}

createRoot(document.getElementById('root')).render(
  <FavoriteColor />
);
```

Run Example »

You must `import` Hooks from `react`.

Here we are using the `useState` Hook to keep track of the application state.

Hook Rules

There are 3 rules for hooks:

- Hooks can only be called inside React function components.
- Hooks can only be called at the top level of a component.
- Hooks cannot be conditional

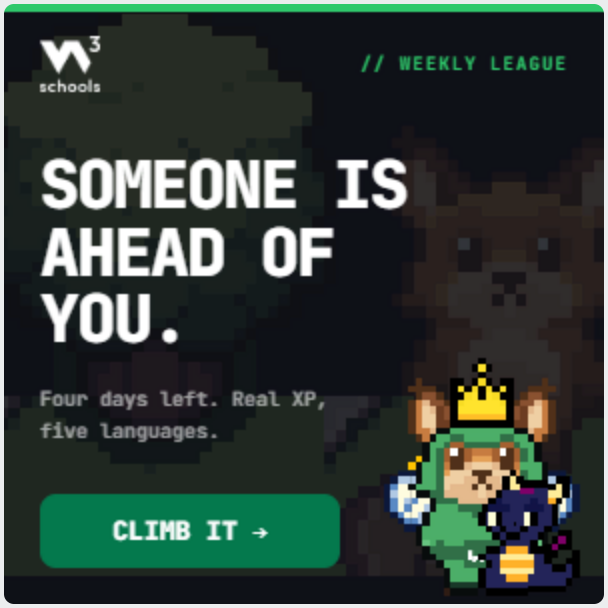

Note: Hooks will not work in React class components.

Custom Hooks

If you have stateful logic that needs to be reused in several components, you can build your own custom Hooks.

We'll go into more detail in the Custom Hooks section.
