React Props Children

‹ Previous Next ›

Props Children

SHARE

In React, you can send the content between the opening and closing tags of a component, to another component.

This can be accessed in the other component using the `props.children` property.

Example

Get your own React.js Server

From the `Parent` component, send the content between the opening and closing tags of the `Son` and `Daughter` components:

```
function Son(props) {
  return (
    <div style={{background: 'lightgreen'}}>
      <h2>Son</h2>
      <div>{props.children}</div>
```

```
function Daughter(props) {
  const {brand, model} = props;
  return (
    <div style={{background: 'lightblue'}}>
      <h2>Daughter</h2>
      <div>{props.children}</div>
    </div>
  );
}

function Parent() {
  return (
    <div>
      <h1>My two Children</h1>
      <Son>
        <p>
          This was written in the Parent component,
          but displayed as a part of the Son component
        </p>
      </Son>
      <Daughter>
        <p>
          This was written in the Parent component,
          but displayed as a part of the Daughter component
        </p>
      </Daughter>
    </div>
  );
}

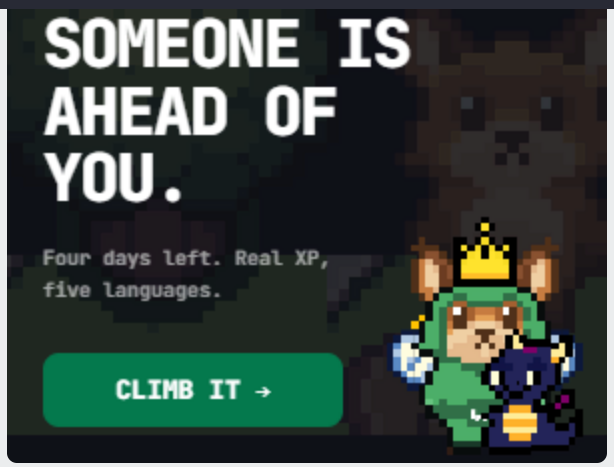

createRoot(document.getElementById('root')).render(
  <Parent />
);
```
